

Torah Poetic Organization: Example Catalogue

Analytical purpose, examples, and evidential status

Repository companion

How to Read This Catalogue

The catalogue is organized by analytical purpose. Every entry states why the example matters for a study of poetic organization in the Torah, what it demonstrates, and how its evidential weight should be understood.

Most material comes from the Pentateuch. A small comparative section at the end uses Psalms and later liturgy as auditory calibration, making particular sound mechanisms especially easy to hear before subtler Torah cases are considered.

Evidence is graded. Exact lexical repetition, received phrase or verse closure, and strict stress-defined terminal recurrence are relatively constrained. Medial, junctional, composite, and broad sound-field relations are more interpretive and are labelled accordingly.

Source and Transcription Audit

All Torah references and displayed Torah forms in this version were checked against the repository's frozen Sefaria snapshot, version 'Tanach with Ta'amei Hamikra'. Display transcription follows the project's pronunciation-oriented conventions rather than the deterministic repository transliteration; known differences between the two are stated only where they affect analysis.

Psalm 40.8-9 and Psalm 104.4-5 were checked against Miqra According to the Masorah (MAM) on Sefaria. Ana Be-koach is presented in the author-supplied listening text, retaining the attested rachamei tzidkatekha variant. It is not a diplomatic reproduction of Sefaria's Metsudah Siddur Ashkenaz version, which reads rachamem. See the textual note in section 5.3; displayed vocalization and pronunciation are not an attribution to a particular historical rite.

Biblical references use chapter.verse style (Gen. 1.1-5). Repository command-line ranges may still use chapter:verse syntax because that is the tool's input format.

Evidence Labels

CORE - Strong case used to establish or directly test the analytical framework.

SUPPORTING - Additional example illustrating a defined mechanism.

TEXTUAL-FORM - Case whose interest depends on qere/ketiv or another marked textual form.

EXPLORATORY - Perception-dependent or more interpretive proposal retained for testing.

ORIENTATION - Non-Pentateuchal example used only to make an auditory mechanism easier to recognize.

Transcription and Repository Relation

The passage-inspection tool audits word-final correspondence pairs under explicit parameters but does not decide literary function. It also does not capture every medial, junctional, composite, rhetorical, or long-range relation in this catalogue.

The current STRICT terminal protocol is narrower than the catalogue's full descriptive vocabulary. A conspicuous auditory relation that fails the STRICT definition is therefore labelled more narrowly - for

example as a broader echo, medial relation, or exploratory correspondence - rather than silently counted as strict rhyme.

The repository also provides a separate descriptive distribution visualization of the same operational word-final correspondence rule across the five books; its parameters and outputs are documented independently in Protocol 4.

Audio files are documented separately in audio/. This catalogue mentions a recording only when it directly accompanies an analytical case; it is not intended as an exhaustive index of current or future recordings.

1. Framing and Marked Torah Forms

The opening entries establish two distinct points. Deut. 31.19 provides a textual frame in which writing, teaching, oral placement, and the repeated phrase ha-shira ha-zot converge. The following marked-form cases ask a narrower question: can a received qere or an unusual textual form also participate in local sound organization without implying that the form arose for poetic reasons?

1.1 Deuteronomy 31.19 - writing, teaching, and ha-shira ha-zot

Status: SUPPORTING **Reference:** Deut. 31.19 **Mechanism:** parallel imperatives; repeated framing phrase; oral-transmission language

Why this example is here. Deut. 31.19 is an especially suggestive framing text for the hypothesis explored in this project. Writing, teaching, oral placement ('put it in their mouths'), and the repeated designation ha-shira ha-zot occur within one compact unit, linking textual transmission and performed speech through the language of shira.

Ve-atta kitvu lakhem et ha-shira ha-zot,
ve-lammedah et bnei Yisrael,
simah be-fihem,
lema'an tihyeh li ha-shira ha-zot
le-ed bivnei Yisrael.

What it demonstrates. Three imperatives - kitvu, lammedah, simah - move from writing to teaching to placing the text 'in their mouths'. The repeated ha-shira ha-zot frames that movement and gives the unit a readily segmentable rhetorical shape.

1.2 Leviticus 25.30 - qere lo within a dense lo-chain

Status: TEXTUAL-FORM **Reference:** Lev. 25.30 **Mechanism:** qere/ketiv; exact lexical repetition

Why this example is here. The example asks whether the performed qere of the received text can participate in local sound patterning even when the consonantal level is different.

ve-im lo yiga'el ...
ad-melot lo shanah temimah ...
asher lo choma ...
lo yetze ba-yovel

What it demonstrates. The received qere in asher lo choma joins a dense series of lo forms already present in the verse, so the read form participates in the audible chain.

Interpretive note. Both the ketiv lo (לֹ) and the qere lo (לו) have the same pronunciation under the adopted convention. The example concerns the participation of the received reading in the chain; it does not show a new sound correspondence created by the qere/ketiv distinction.

1.3 Deuteronomy 21.15-16 - senu'ah, ha-senu'ah, la-seni'ah | ve-hayah

Status: TEXTUAL-FORM **Reference:** Deut. 21.15-16 **Mechanism:** marked textual form; cross-verse boundary linkage

Why this example is here. The interest lies in the sequence of forms, not merely in the final resemblance. The ordinary senu'ah form occurs twice in v. 15; the verse then closes with la-seni'ah, and v. 16 immediately opens ve-hayah.

... ve-ha-achat senu'ah ...
... ha-ahuvah ve-ha-senu'ah ...
ve-hayah ha-ben ha-bekhor la-seni'ah |
ve-hayah bayom hanchilo et-banav ...

What it demonstrates. The progression senu'ah -> ha-senu'ah -> la-seni'ah is followed at the textual boundary by ve-hayah. The marked verse-final form therefore participates in a boundary-spanning auditory linkage.

Interpretive note. The analytical point is functional: in the received text, la-seni'ah closes the verse and immediately links acoustically to the following ve-hayah.

2. Basic Sound Techniques in Torah Passages

These entries move from the most constrained terminal identities to broader categories such as exact repetition, assonance, consonantal resonance, accentual correspondence, medial echo, and composite or junctional effects. The labels are intentionally not interchangeable.

2.1 Strict-compatible terminal recurrence - baseline examples

Status: SUPPORTING **Reference:** Deut. 6.8; Gen. 1.1-2; Deut. 18.10-14 **Mechanism:** stress-defined terminal identity

Why this example is here. The catalogue needs a baseline category before introducing less direct relations. These examples use different lexemes whose stress-defined terminal signatures coincide without requiring extended consonantal equivalence or cross-word fusion.

Deut. 6.8: le-ot ... le-totafot
Gen. 1.1-2: ha-shamayim ... ha-mayim
Deut. 18.10-14: ba-esh ... u-menachesh ... ve-doresh ... yoresh

What it demonstrates. Straightforward terminal identities in -ot, -ayim, and -esh.

2.2 Exodus 14.29-30 - ba-yabashah | va-yosha as a broader echo

Status: SUPPORTING **Reference:** Exod. 14.29-30 **Mechanism:** cross-verse auditory echo with different stress-defined signatures

Why this example is here. This conspicuous pair is useful precisely because the present STRICT protocol does not classify it as a full stress-defined rhyme. It illustrates the difference between a broader auditory resemblance and a computationally strict terminal match.

U-vnei Yisrael halkhu ba-yabashah be-tokh ha-yam,
ve-hamayim lahem chomah mi-yeminam u-mi-semolam. |
Va-yosha A-donai ba-yom ha-hu ...

What it demonstrates. The proposed -yabashah / -yosha echo spans the latter part of v. 29 and the opening of v. 30. Seven words intervene after ba-yabashah before va-yosha; the two forms are not adjacent to the same verse boundary.

Interpretive note. Under the current stress-defined protocol, ba-yabashah and va-yosha have different full terminal signatures; the relation is therefore classified as a broader cross-verse echo rather than a STRICT match.

2.3 Exodus 13.1-10 - recurrence across a longer performed unit

Status: SUPPORTING **Reference:** Exod. 13.1-10 **Mechanism:** lexical return; formulaic recurrence; suffixal field; long-range return

Why this example is here. The later audio realization makes this longer passage useful for hearing several kinds of recurrence accumulate across successive verses. The point is not to collapse them into one rhyme class, but to observe how lexical return, repeated syntax, suffixal concentration, and longer-range echoes can coexist in one continuous unit.

Qaddesh-li khol-bekhor, peter kol-rechem ... li hu.
zakhor et-ha-yom ha-zeh ... mi-zeh.
Ha-yom atem yotzim be-chodesh ha-aviv.
... ve-avadta et-ha-avodah ha-zot ba-chodesh ha-zeh.
Shiv'at yamim tokhal matzot ... ha-yom ha-shevi'i ... shiv'at ha-yamim.
... ve-lo yera'eh lekha chametz, ve-lo yera'eh lekha se'or ...
... lekha / yadkha / einekha / be-fikha / hotzi'akha ...
be-chozeq yad ... / be-yad chazaqah ...
ve-shamarta et-ha-chuqqah ha-zot le-mo'adah,
mi-yamim yamimah.

What it demonstrates. The unit moves from compact returns such as bekhor / zakhor and ha-yom ha-zeh / mi-zeh / ha-zeh through repeated day/festival vocabulary and the exact syntactic frame ve-lo yera'eh lekha ... ve-lo yera'eh lekha. Verse 9 concentrates second-person forms (lekha / yadkha / einekha / be-fikha / hotzi'akha), while be-chozeq yad / be-yad chazaqah and the closing mi-yamim yamimah create returns across longer spans.

Audio relation. An experimental rhythmic realization of Exod. 13.1-10 is supplied as audio/exodus_13_1-10_experimental.mp3; full listening notes are in audio/exodus_13_1-10.md.

2.4 Deuteronomy 11.17 - broad assonance rather than exact rhyme

Status: SUPPORTING **Reference:** Deut. 11.17 **Mechanism:** final-vowel field; pronunciation sensitivity

Why this example is here. This example separates assonance from exact terminal rhyme: several important clause endings concentrate a similar low-vowel color even though their consonantal endings differ.

ha-adamah ... yevulah ...
meherah ... ha-aretz ha-tovah

What it demonstrates. A broad /a/-dominant field near salient clause endings under the adopted reading.

Interpretive note. This is a qualitative assonance field rather than a STRICT terminal-rhyme class; pronunciation tradition affects its acoustic strength.

2.5 Genesis 6.9 - exact repetition as structural sound

Status: SUPPORTING **Reference:** Gen. 6.9 **Mechanism:** exact lexical repetition / structural anchor

Why this example is here. Exact repetition should not automatically be discarded as trivial. Placement can turn a repeated name into an audible frame or anchor.

Eleh toledot Noach,
Noach ish tzaddiq tamim hayah be-dorotav;
et ha-E-lohim hithalekh Noach.

What it demonstrates. Three occurrences of Noach keep the subject acoustically present across genealogy, description, and closing clause.

2.6 Genesis 1.1-2 - consonantal and prefixal texture

Status: CORE **Reference:** Gen. 1.1-2 **Mechanism:** alliteration; recurrent onset; local sound texture

Why this example is here. The opening shows why sound organization cannot be reduced to terminal rhyme: repeated onsets and consonantal texture are already active before the chapter's larger formulas are considered.

Bereshit
bara
veha'aretz
vavohu
vechoshekh
veruach

What it demonstrates. Bereshit / bara forms a b/r echo; ha'aretz and veruach extend the r-rich texture; recurrent ve-/va- onsets give successive phrases a related beginning.

Interpretive note. This entry concerns local sound texture; the stronger Genesis 1 case emerges when such texture converges with lexical return, formulaic recurrence, and phrase closure.

2.7 Numbers 21.9 - nechash / nechoshet / nashakh in one local sequence

Status: SUPPORTING **Reference:** Num. 21.9 **Mechanism:** consonantal resonance inside one verse

Why this example is here. The n/ch/sh family is concentrated within one verse, making it a well-defined example of consonantal resonance rather than an abstract three-word list.

Va-ya'as Moshe nechash nechoshet ...
ve-hayah im-nashakh ha-nachash et-ish,
ve-hibbit el-nechash ha-nechoshet va-chai.

What it demonstrates. Nechash / ha-nachash and nechoshet repeatedly share n-ch-sh material, while nashakh offers a looser resonance involving kh rather than ch in the declared transcription; it is not an exact permutation of the same consonants.

Interpretive note. The relation is consonantal resonance rather than terminal rhyme.

2.8 Genesis 18.9-10 - received accentuation and elékha / ishtékha

Status: SUPPORTING **Reference:** Gen. 18.9-10 **Mechanism:** Masoretically supported accentual correspondence

Why this example is here. This tests whether a correspondence dependent on prominence is supported by received accentuation rather than created by the analyst.

Gen. 18.9: ... Sarah ishtékha ...
Gen. 18.10: shov ashuv elékha ... le-Sarah ishtékha ...

What it demonstrates. Ishtékha is penultimate under the received accentuation; in v. 10 elékha likewise supplies a penultimate ending, so the echo does not require an invented stress shift.

2.9 Genesis 22.12, 18 - a weaker accentual return

Status: EXPLORATORY **Reference:** Gen. 22.12, 18 **Mechanism:** accentual form entering a longer sound field

Why this example is here. This weaker case defines the boundary of the accentual category: inherited prominence may reinforce a distant echo, but distance and reduced similarity lower its evidential weight.

Gen. 22.12: ... ki-yere E-lohim áta ...

Gen. 22.18: ... asher shamá'ta be-qoli.

What it demonstrates. A possible /ata/ return across the narrative.

2.10 Genesis 22.17 - junctional correspondence across a word boundary

Status: EXPLORATORY **Reference:** Gen. 22.17 **Mechanism:** continuous-speech boundary effect

Why this example is here. The example asks whether oral continuity can make a relation perceptible across a word boundary rather than at a lexical ending.

... s'fat | ha-yam ...

Research question. Could continuous delivery of this phrase contribute to a wider sound field? A specific comparison partner and segmental rule have not yet been established for this proposal; it is not counted as demonstrated correspondence.

Interpretive note. The proposed effect belongs to continuous oral delivery across the word boundary and is therefore perceptual rather than orthographic.

2.11 Deuteronomy 11.14 - one word in two overlapping sound relations

Status: CORE **Reference:** Deut. 11.14 **Mechanism:** medial lexical echo + terminal suffixal field

Why this example is here. A terminal-only analysis cannot see this mechanism: a morphologically complex word can carry an internal echo while its ending participates in a different chain.

yoreh u-malqosh;

ve-asafta deganekha ve-tiroshkha ve-yitzharekha.

What it demonstrates. Internal tirosh- echoes malqosh, while the full tiroshkha continues into the surrounding -ekha field.

Interpretive note. The medial echo does not depend on shifting the principal stress. The display form ve-tiroshkha follows the pronunciation-oriented convention used here.

Repository audit. A frozen STRICT inspection output for Deut. 11.10-15 is included at [results/passages/deuteronomy_11-10_11-15_strict/](https://github.com/linguistics/results/passages/deuteronomy_11-10_11-15_strict/).

2.12 Genesis 22.1 - proposed composite closure toward hineni

Status: EXPLORATORY **Reference:** Gen. 22.1 **Mechanism:** distributed partial cues before a stronger closing form

Why this example is here. This defines 'composite' correspondence as an explicitly interpretive category: several partial cues may accumulate even when no preceding word forms a direct rhyme with the closing word.

Vayehi achar ha-devarim ha-eleh

ve-ha-E-lohim nisa et Avraham

va-yomer elav Avraham
va-yomer hineni.

Research question. Ha-eleh and nisa have been proposed as partial cues before hineni. A reproducible rule for selecting and combining those cues has not been specified, so this entry records a listening hypothesis rather than an established composite match.

Interpretive note. This is a cumulative, perception-dependent relation and is therefore kept distinct from direct terminal rhyme.

2.13 Genesis 37.1-2 - distributed field before echav

Status: EXPLORATORY **Reference:** Gen. 37.1-2 **Mechanism:** distributed vowel/consonant field; proposed composite closure

Why this example is here. This second composite case asks whether a weakly distributed field can prepare a more explicit later recurrence.

Vay-yeshev Ya'aqov be-eretz megurei aviv,
be-eretz Kena'an.
Eleh toldot Ya'aqov:
Yosef ben sheva-'esre shanah, hayah
ro'eh et echav ...

What it demonstrates. A possible field across yeshev, aviv, Kena'an, and the later echav, with a further explicit occurrence of echav in Gen. 37.4, outside the displayed range.

Interpretive note. This entry defines a possible perceptual mechanism for distributed sound fields; its status remains exploratory.

3. Parallelism and Recurrence across Larger Units

These cases shift from local sound to repeated formulas and rhetorical shapes that operate across larger textual spans.

3.1 Deuteronomy 6 and 11 - formulaic parallelism across related passages

Status: CORE **Reference:** Deut. 6.7-9; 11.19-20 **Mechanism:** repeated instructional formulas across textual distance

Why this example is here. The passages share thematic ground, so the question is how stable wording and cadence reinforce continuity across separate units.

be-shivtekha be-veitekha,
u-ve-lekhtekha ba-derekh,
u-ve-shokhbekha u-ve-qumekha.

U-khtavtam al mezuzot beitekha
u-vish'arekha.

What it demonstrates. The domestic-journey sequence and threshold-writing formula recur with closely matching wording.

3.2 Deuteronomy 25.17-19 and Numbers 14.8-9 - comparable rhetorical shape

Status: EXPLORATORY **Reference:** Deut. 25.17-19; Num. 14.8-9 **Mechanism:** cross-passage rhetorical/cadential parallelism

Why this example is here. Because the passages are contextually unrelated, they provide a harder test of recurring short-clause and terminal-command shapes.

Deut. 25:
ve-ata ayef ve-yagea,
ve-lo yare E-lohim.

...
Lo tishkach.

Num. 14:
akh ba-A-donai al timrodu,
ve-atem al tire'u et am ha'aretz ...
va-A-donai itanu.
Al tira'um.

What it demonstrates. Both units compress toward short terminal commands after longer clauses.

4. Extended Torah Case Files

These longer entries gather several mechanisms inside continuous passages and are therefore more important than isolated word pairs.

4.1 The Shema passages - compatible structures across three Torah units

Status: CORE **Reference:** Deut. 6.4-9; 11.13-21; Num. 15.37-41 **Mechanism:** suffixal fields; formulaic return; medial echo; lexical framing

Why this example is here. The three passages later recited together provide a demanding test of formal compatibility across separate Torah units.

Deut. 6:
Ve'ahavta et A-donai E-lohekha be-khol levavkha,
u-ve-khol nafshekha,
u-ve-khol me'odekha.

...
be-shivtekha be-veitekha,
u-ve-lekhtekha ba-derekh,
u-ve-shokhbekha u-ve-qumekha.
U-qeshartam le-ot al yadekha,
ve-hayu le-totafot bein einekha.
U-khtavtam al mezuzot beitekha
u-vish'arekha.

Deut. 11:
... yoreh u-malqosh;
ve-asafta deganekha ve-tiroshkha ve-yitzharekha.

...
be-shivtekha be-veitekha,
u-ve-lekhtekha ba-derekh,
u-ve-shokhbekha u-ve-qumekha.
U-khtavtam al mezuzot beitekha u-vish'arekha.

Num. 15:
Ve-asu lahem tzitzit ...
Vehaya lakhem le-tzitzit,
u-re'item oto u-zekhartem ...

...
Ani A-donai E-loheikhem ...
Ani A-donai E-loheikhem.

What it demonstrates. Deut. 6 concentrates singular -kha/-ekha endings, the le-ot / le-totafot relation, and recurring instructional formulas; Deut. 11 alternates collective and individualized address while reusing the domestic-journey formula and adding malqosh / tirosh-; Num. 15 shifts to tzitzit repetition, shorter sound fragments, and exact divine-name framing.

4.2 Genesis 1 - narrative organization across scales

Status: CORE **Reference:** Gen. 1.1-5; Gen. 2.1-3 **Mechanism:** local echo; long-range return; formulaic recurrence; Masoretic phrasing

Why this example is here. Genesis 1 tests sound organization inside narrative alongside the chapter's well-known formulaic architecture.

Bereshit bara E-lohim et hashamayim ve'et ha'aretz.
Veha'aretz hayetah tohu vavohu, vechoshekh al penei tehom,
veruach E-lohim merachefet al penei hamayim.

Vayomer E-lohim yehi or, vayehi or.
Vayar E-lohim et ha'or ki tov;
vayavdel E-lohim bein ha'or u-vein hachoshekh.
Vayiqra E-lohim la'or yom, ve-lachoshekh qara laila.
Vayehi erev vayehi voqer, yom echad.

What it demonstrates. Tohu-vohu and yehi or-vayehi or operate locally; tehom-yom supplies a longer-range return; E-lohim formulas and evening-morning closures organize larger spans.

4.3 Exodus 34.23-24 - refrain framing and a performance heuristic

Status: SUPPORTING **Reference:** Exod. 34.23-24 **Mechanism:** lexical frame; repeated three-times formula; optional ternary grouping

Why this example is here. The repeated shalosh pe'amim ba-shanah frame is textual and immediately visible, making this a useful bridge between repetition and a more tentative performance hypothesis.

Shalosh pe'amim ba-shanah
yera'eh kol-zekhurkha
et-penei ha-Adon A-donai E-lohei Yisrael.

...
ba'alotkha lera'ot
et-penei A-donai E-lohekha
shalosh pe'amim ba-shanah.

What it demonstrates. The repeated formula creates a cyclical lexical frame; a ternary realization can then be tested independently.

Interpretive note. The lexical frame is textual; the ternary realization is a separate performance hypothesis that can be tested experimentally.

4.4 The Decalogue - legal authority through anaphora and compact cadence

Status: SUPPORTING **Reference:** Exod. 20.2-14; Deut. 5.6-18 **Mechanism:** Lo-anaphora; short prohibition series; suffixal fields; rhetorical progression

Why this example is here. The Decalogue shows how legal force can be carried by repeated negative openings and compressed prohibitions without requiring an extended rhyme scheme.

Anokhi A-donai E-lohekha,
asher hotzeitikha me-eretz Mitzrayim,
mi-beit avadim.

Lo yihyeh lekha E-lohim acheirim al panai.
Lo ta'aseh lekha pesel ...

Lo tirtzach.
Lo tin'af.
Lo tignov.

Deut. 5.18:
Lo tachmod ... ve-lo tit'aveh ...

What it demonstrates. Lo-anaphora, compact matched prohibitions, and recurring second-person suffixes create formal cohesion.

Interpretive note. Tin'af / la-shav belongs to the project's graded f/v correspondence and is not counted as a STRICT identity match.

4.5 Leviticus 25.35-38 - economic law as a demanding case

Status: CORE **Reference:** Lev. 25.35-38 **Mechanism:** recurrent verse closure; syntactic parallelism; singular-to-plural shift

Why this example is here. Technical economic law is a demanding case for asking whether formal sound organization extends beyond lyrical or narrative material.

Ve-khi yamukh achikha
u-mata yado immakh,
ve-hechezaqta bo,
ger ve-toshav,
va-chai immakh.

Al tiqach me-ito neshekh ve-tarbit,
ve-yareta me-E-lohekha,
ve-chei achikha immakh.

Et kaspekha
lo titten lo be-neshekh,
u-ve-marbit
lo titten okhlekha.

Ani A-donai E-loheikhem,
asher hotzeiti etkhem me-eretz Mitzrayim,
latet lakhem et eretz Kena'an,
lihyot lakhem le-E-lohim.

What it demonstrates. Vv. 35 and 36 share the verse-final immakh cadence; v. 37 builds a strict lo titten parallel; v. 38 shifts from singular obligation to a plural covenantal frame.

4.6 Numbers 18.8-10 - institutional allocation and enumerative sound

Status: CORE **Reference:** Num. 18.8-10 **Mechanism:** pronominal recurrence; enumerative -am sequence; qodesh framing

Why this example is here. This legal case tests recurrent sound inside administrative enumeration rather than interpersonal ethics.

Va-yedabber A-donai el Aharon,
va-ani hinne natatti lekha
et mishmeret terumotai,
le-khol qodshei bnei Yisrael,
lekha netattim ...
u-le-vanekha le-choq olam.

Ze yihye lekha mi-qodesh ha-qodashim ...
kol qorbanam,
le-khol minchatam,
u-le-khol chattatam,
u-le-khol ashmam ...
qodesh qodashim lekha hu u-le-vanekha.

Be-qodesh ha-qodashim tokhalenu ...
qodesh yihye lakh.

What it demonstrates. Lekha marks entitlement points; the -am sequence structures the list; qodesh vocabulary frames the sacred domain.

4.7 Deuteronomy 19.15-19 - judicial symmetry without lyric content

Status: CORE **Reference:** Deut. 19.15-19 **Mechanism:** lexical return; numerical progression; reciprocal legal structure; conventional closure

Why this example is here. This austere procedural unit tests formal organization where conventional poetic motivation is especially weak.

Lo yaqum ed echad be-ish ...
al pi shnei edim
o al pi shloshe edim
yaqum davar.

Ki yaqum ed chamas be-ish ...
ve-hinne ed sheqer ha-ed,
sheqer ana be-achiv.

Va-asitem lo
ka-asher zamam la-asot le-achiv;
u-viarta ha-ra mi-qirbekha.

What it demonstrates. Ed changes legal status through the procedure; numerical escalation and reciprocal penalty mirror the legal logic.

5. Orientation and Comparative Calibration

These comparative examples serve as auditory calibration. Because their sound organization is especially conspicuous, they make particular mechanisms easy to recognize before subtler Torah instances are considered.

5.1 Psalm 40.8-9 - a compact recognized-poetic rhyme network

Status: ORIENTATION **Reference:** Ps. 40.8-9 **Mechanism:** multiple simultaneous end relations in a recognized poetic corpus

Why this example is here. A short Psalm unit makes layered rhyme relations easy to hear before similar layering is considered in less obvious contexts.

Az amarti hinne-ba'ti
bimgillat-sefer katuv alai.
La'asot-retzonkha E-lohai chafatzti
ve-toratkha be-tokh me'ai.

What it demonstrates. Alai / me'ai form a paired ending; ba'ti / chafatzti adds a partial cross-line correspondence, not identity of the full stressed ending.

5.2 Psalm 104.4-5 - grammatical comparator for marked-form analysis

Status: ORIENTATION **Reference:** Ps. 104.4-5 **Mechanism:** grammatical agreement + graded t/d terminal relation

Why this example is here. This comparator belongs conceptually beside the marked Torah forms but remains separated because it is outside the Pentateuch. It shows a third textual level: grammatical agreement rather than qere/ketiv or consonantal spelling.

Ps. 104.4: ... esh lohet |
Ps. 104.5: ... olam va'ed.

What it demonstrates. The /et/-/ed/ near echo crosses the verse boundary if t/d are treated as a graded consonantal pair.

Interpretive note. The relation spans Ps. 104.4-5 and uses the project's graded t/d correspondence.

5.3 Ana Be-koach - dense interlaced rhyme as auditory orientation

Status: ORIENTATION **Reference:** Ana Be-koach, author-supplied listening text; rachamei variant (see textual note below) **Mechanism:** dense terminal fields; parallel imperatives; percussive cadence

Why this example is here. This example is pedagogical rather than evidential for the Torah. Its dense rhyme fields and repeated imperatives make interlaced sound organization unusually easy to hear.

Ana be'koach gedulat yeminekha tatir tzerurah;
Qabel rinat amekha, sagveinu, tahareinu nora;
Na gibbor, dorshei yichudekha, kevavat shomrem;
Barekhem, taharem, rachamei tzidkatekha tamid gamlem;
Chasin qadosh, berov tuv'kha, nahel adatekha;
Yachid ge'eh, le'amkha p'neh, zokhrei qedushatekha;
Shav'atenu qabel, ushma' tza'akatenu, yodea ta'alumot;
Barukh shem kevod malkhuto le'olam va'ed.

What it demonstrates. Several end fields interact with repeated imperatives such as qabel / barekhem / qabel.

Textual note. The displayed listening text retains rachamei tzidkatekha. The alternative rachamem occurs in the Metsudah Siddur Ashkenaz version on Sefaria; it is not substituted here. Avraham Weiss discusses both variants in his study of the text of Ana Be-koach, published in Ha-Maayan:

<https://www.machonso.org/hamaayan/?gilayon=54&id=1587> (accessed 29 September 2026). This reference documents the variant, not the provenance of the recording or every displayed vocalization.

Interpretive note. The example serves as auditory orientation. Its contribution is the interlacing of recurrent endings and imperative cadence, not a historical argument about the Torah.
